

IoT Platform for Real-Time Monitoring & AI Assistance

From Sensors to Assistant - An Unified Health Monitoring Solution

Acossi Giorgio - Castagna Marco

A Smarter Way to Monitor and Assist

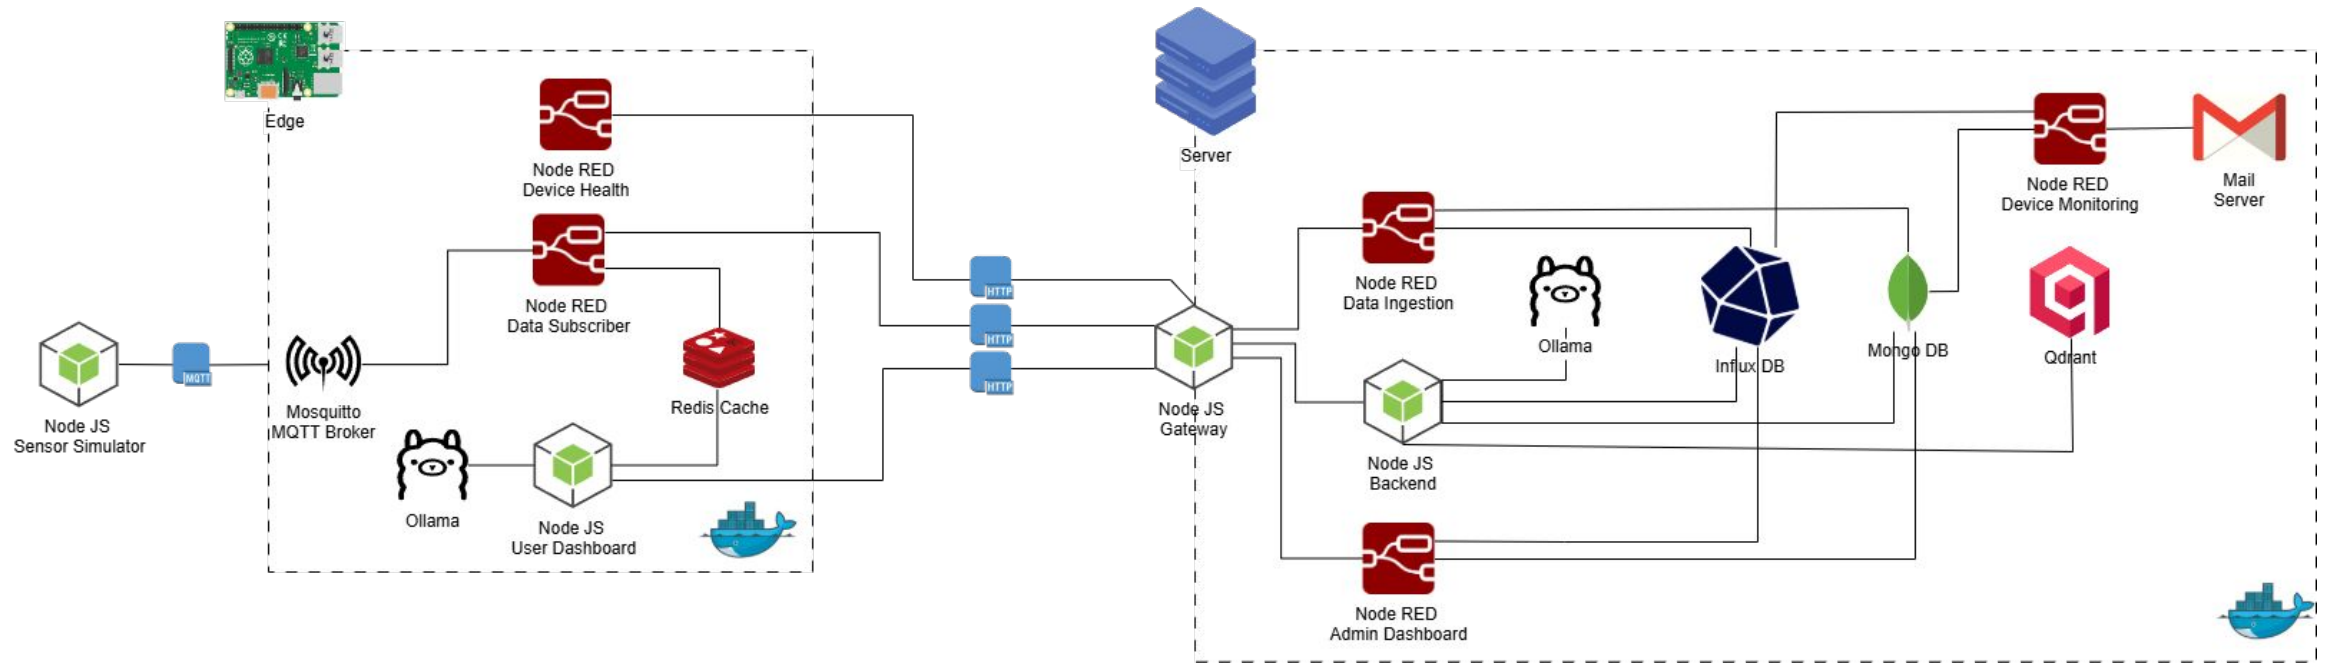

This **platform** acts as a bridge between patients, sensors, and clinicians. It continuously monitors **vital signs** and makes **remote supervision** easier and more reliable for medical experts.

It also provides intuitive **dashboards** and an **AI assistant** capable of interpreting the data, explaining what is happening, and suggesting the most appropriate actions to the patient.

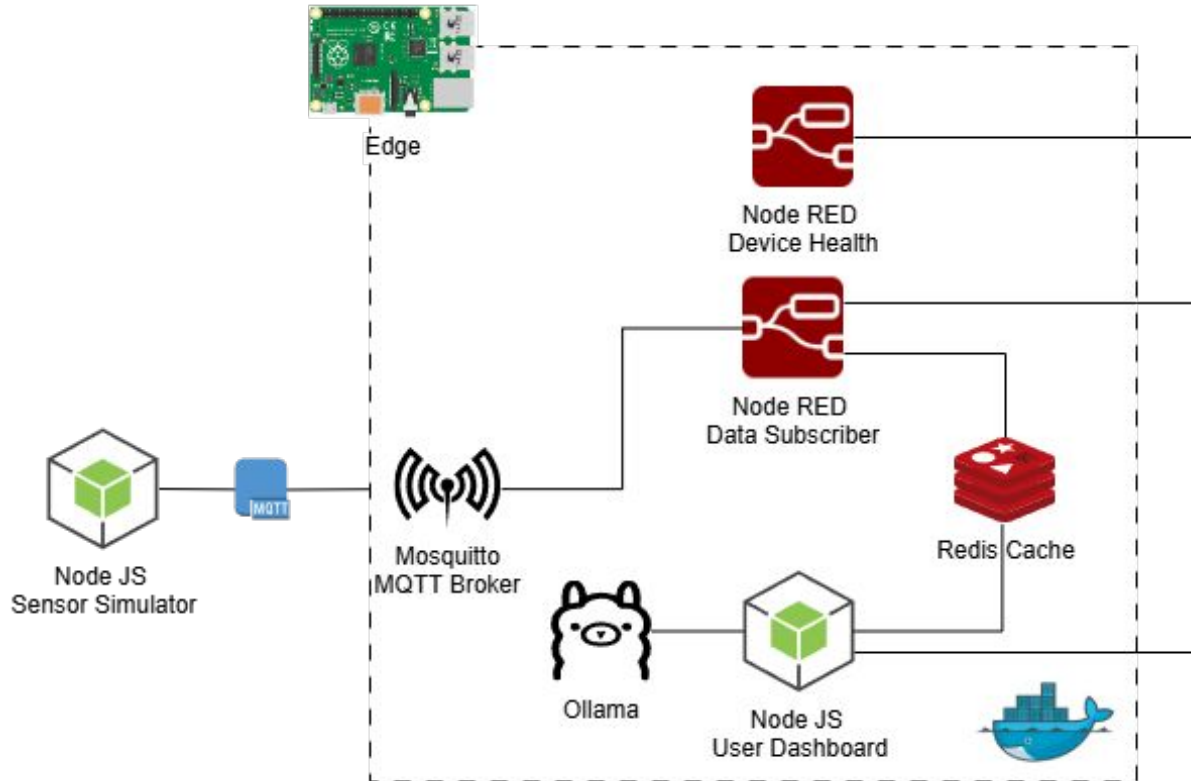

Architecture

Hybrid Approach

Edge Architecture Overview

Data Acquisition

- Sensor simulator
- MQTT broker for edge-level data ingestion

Data Processing & Monitoring

- Device health flow
- Data subscriber flow
- Redis cache for local data storage
- Patient vitals dashboard

AI Assistance

- AI Assistant Chat
- Edge LLM for local filtering and safety

Cloud Architecture Overview

Data Storage

- Time-series storage - InfluxDB
- Application data database - MongoDB
- Vector search index - Qdrant

Data Processing Flows

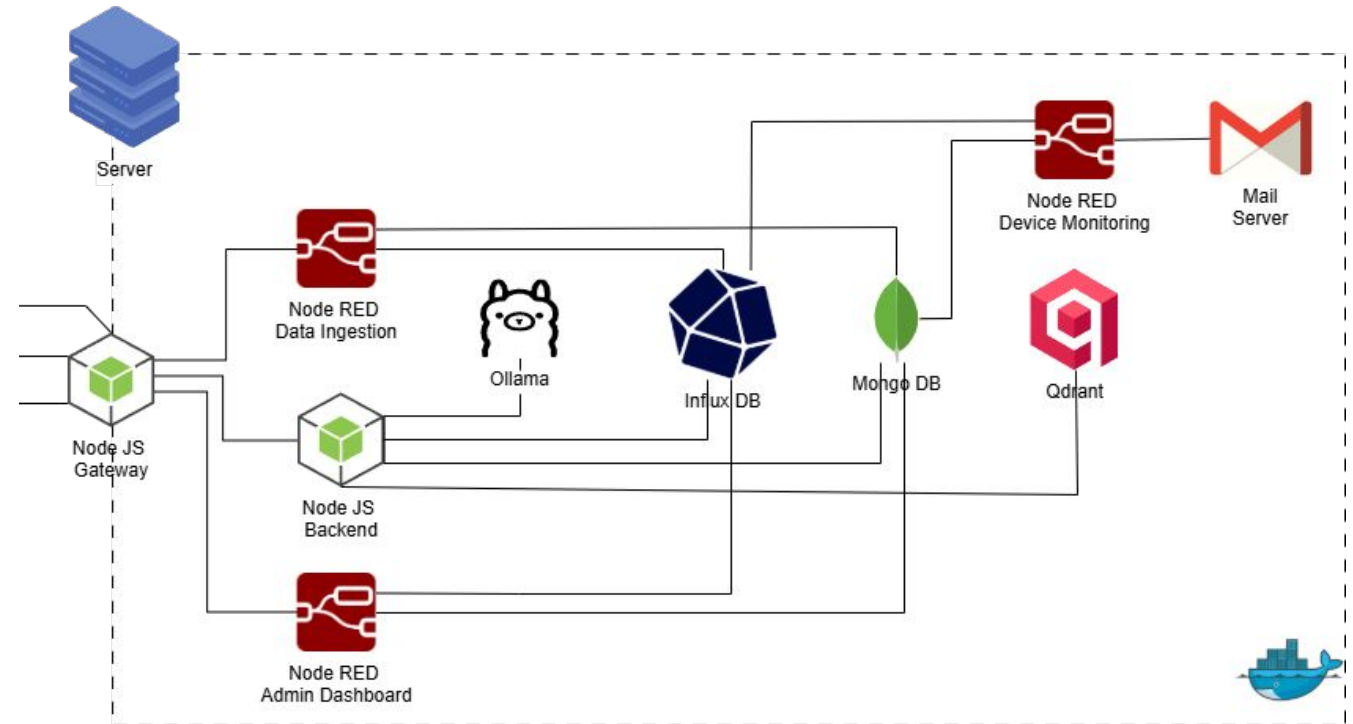

- Data ingestion flow
- Device monitoring flow
- Mail Server for notifications

Dashboards & APIs

- API Gateway and auth
- API Backend
- Admin dashboard

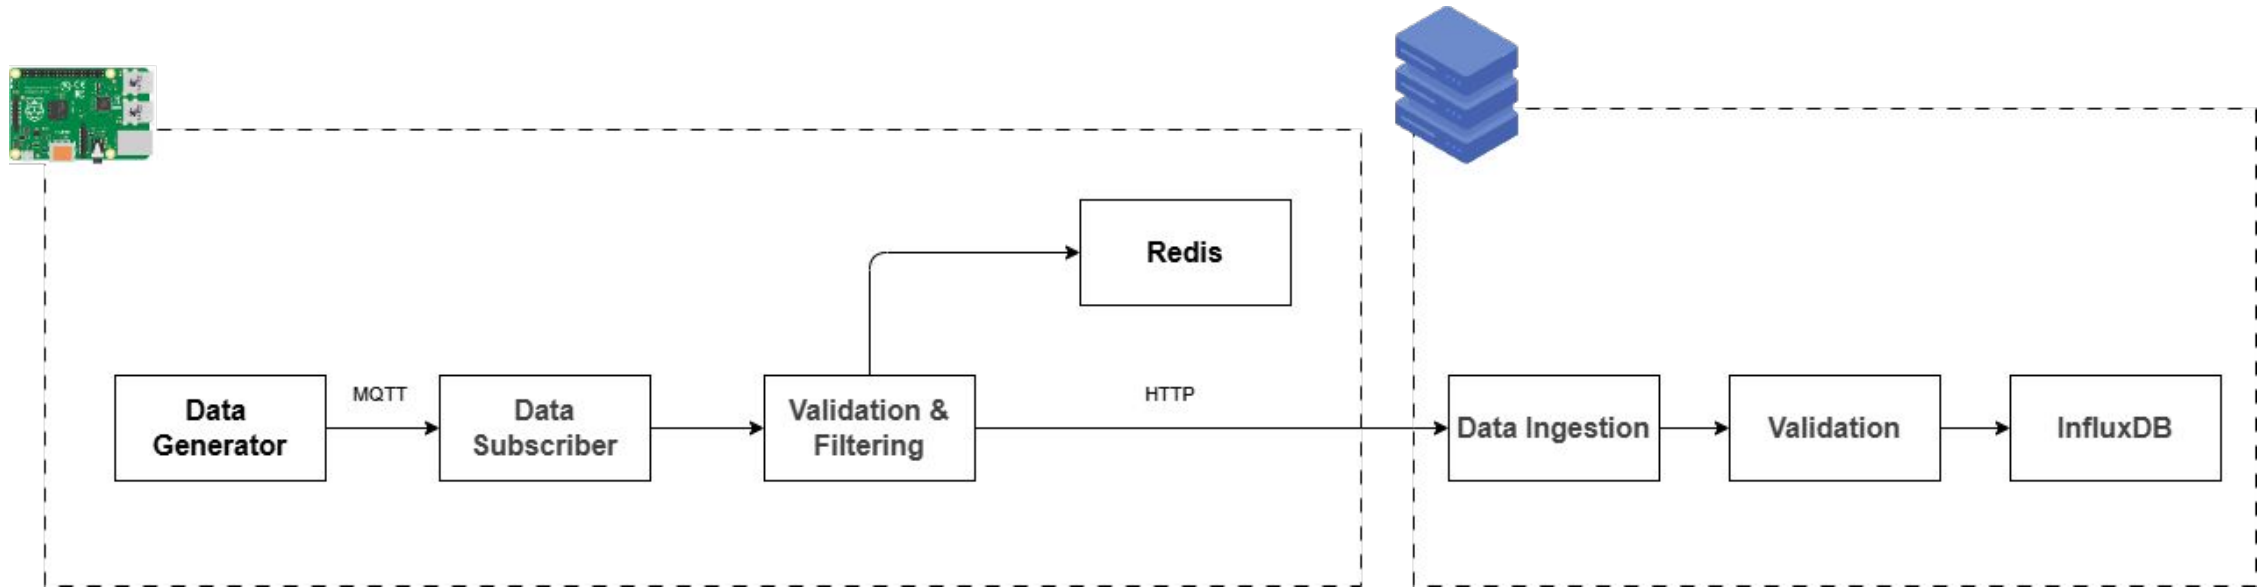

AI Assistant

- Chat (RAG) Pipeline
- Data Analytics Pipeline

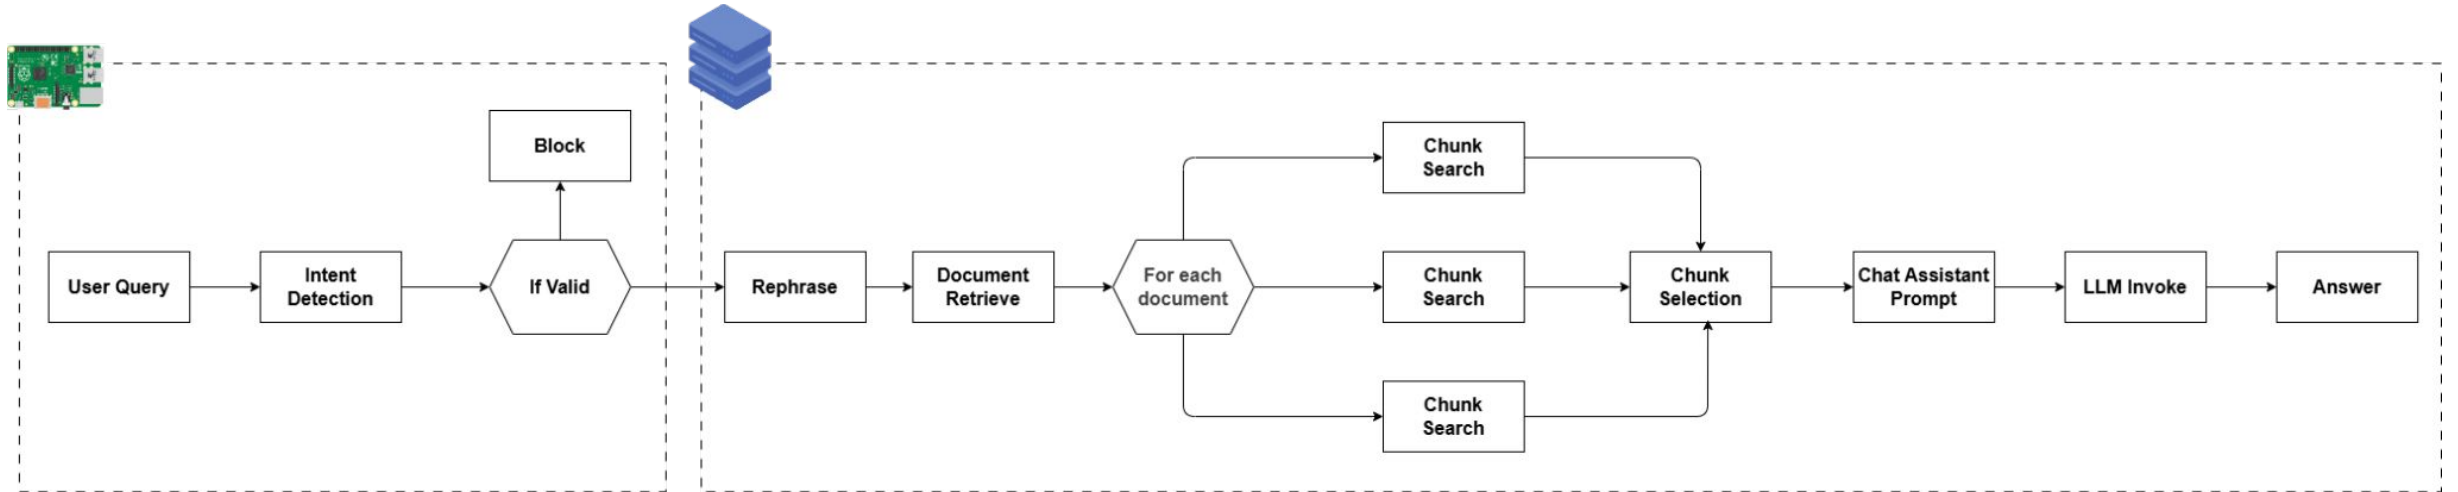

Core Workflow

IoT Data Processing & Ingestion

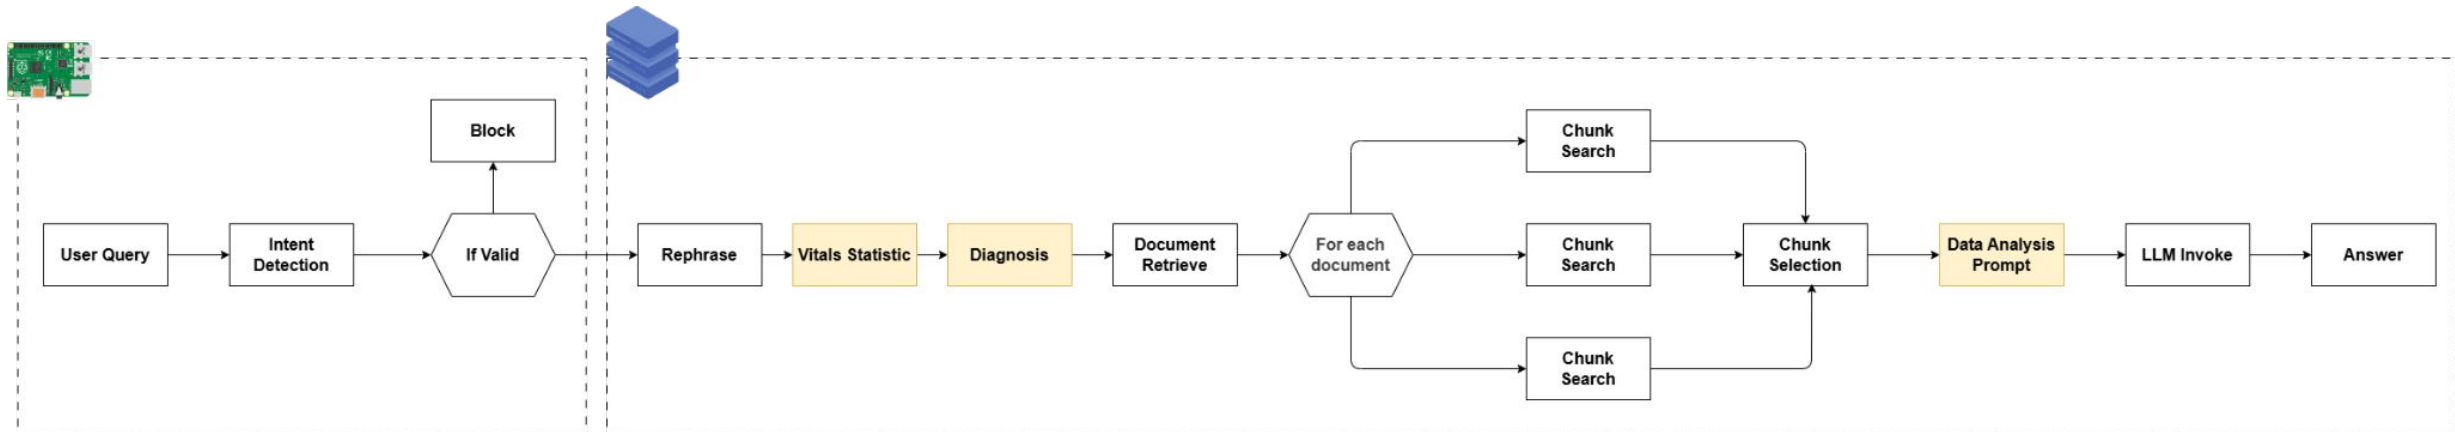

Core Workflow

Chat Assistant

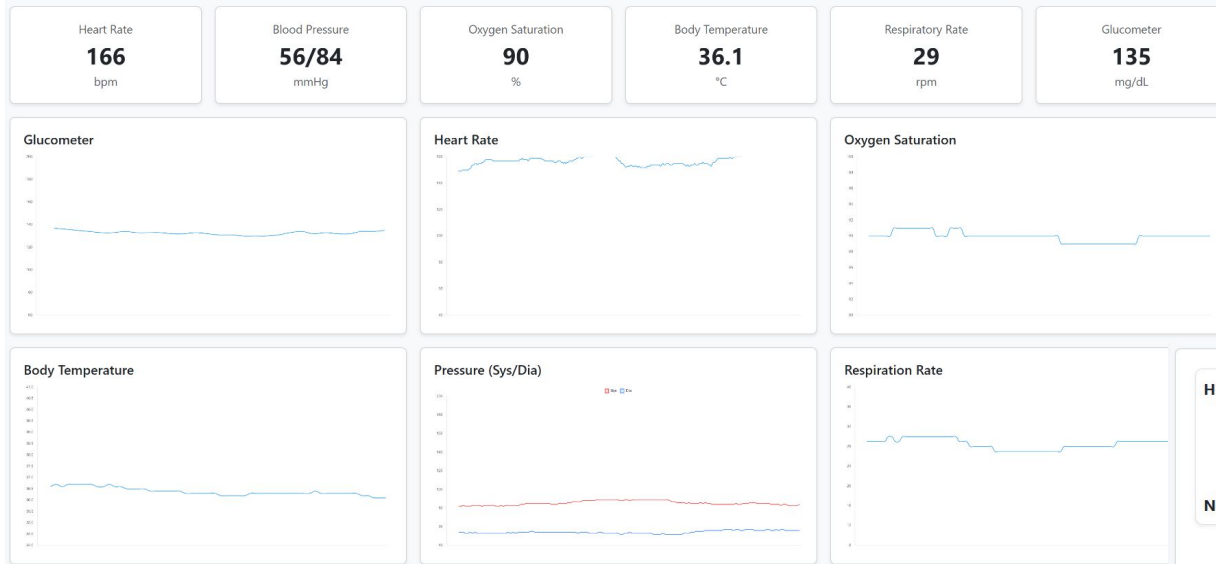

Core Workflow

Data Analysis

Patient Dashboard

Hi! I'm your clinical assistant. I can help you to:

- Formulate and clarify clinical problems
- Analyze your vital data
- Contextualize symptoms and measurements

Note: You can use the **green button** with the chart icon to enable or disable the analysis of your biological data for each query.

I think I have a slight fever. What should I do ?

Could you analyze my vital signs and tell me if there is any problem ? 

Expert Dashboard

Question

Could you analyze my vitals data and tell me if there is any problem?

Rephrased Question

Could you analyze my vital data and tell me if there is anything wrong?

Answer

Your vital signs indicate serious abnormalities requiring immediate medical attention:

- Respiratory Rate:** 29 breaths/minute (normal: 12-20) - significantly elevated, suggesting respiratory distress.
- Oxygen Saturation:** 89% (normal: 96-100%) - critically low, indicating hypoxemia.
- Heart Rate:** 153 bpm (normal: 60-100) - severely elevated tachycardia.
- Systolic Blood Pressure:** 56 mmHg (normal: 90-120) - dangerously low, indicating hypotension.

The combination of low oxygen saturation, very high heart rate, and critically low blood pressure is life-threatening. This pattern is consistent with severe respiratory failure, possible heart attack (myocardial infarction), or dangerous heart rhythm abnormalities. These signs require emergency evaluation and intervention. Do not delay seeking urgent medical care.

Hi! I'm your clinical assistant. I can help you to:

- Formulate and clarify clinical problems
- Analyze your vital data
- Contextualize symptoms and measurements

Type me a question, for example:

- "I don't feel very well, which parameters are out of range?"

I think that i could have some fever, what i could do ?

Take your temperature to confirm a fever (typically defined as 100.4°F/38°C or higher). Rest and drink plenty of fluids to stay hydrated. Monitor your symptoms closely. Seek medical attention immediately if:

- You are under 3 months old with any fever
- Your temperature exceeds 103°F (39.4°C)
- You experience severe symptoms like confusion, stiff neck, shortness of breath, chest pain, or a rash
- Fever lasts more than 3 days without improvement
- You have underlying health conditions like heart disease, diabetes, or weakened immunity

For most adults and older children with mild fever, home care (rest, fluids, over-the-counter pain relievers like acetaminophen or ibuprofen) is sufficient unless symptoms worsen or persist.

Could you analyze my vitals data and tell me if there is any problem ?

Your vital signs are all within normal ranges and show consistent stability. Here's a clear breakdown:

- **Respiration Rate:** 17 breaths per minute (normal range: 12-20), with consistent breathing patterns.
- **Blood Glucose:** 93 mg/dL (normal fasting range: 70-99), showing stable levels.
- **Oxygen Saturation:** 97% (normal range: 95-100%), indicating excellent oxygen levels.
- **Blood Pressure:** 122/72 mmHg (normal: systolic <120, diastolic <80), with stable readings.
- **Heart Rate:** 74 bpm (normal resting range: 60-100), consistent with good cardiovascular function.
- **Body Temperature:** 36.6°C (normal range: 36.1-37.2°C), showing no signs of fever or hypothermia.

All measurements demonstrate low variability, confirming a stable physiological state. There are no indications of medical concerns based on these vitals.

- Analyze your vital data
- Contextualize symptoms and measurements

Note: You can use the **green button** with the chart icon to enable or disable the analysis of your biological data for each query.

Could you analyze my vitals data and tell me if there is any problem ?

Your vital signs show several significant abnormalities that require immediate medical evaluation:

- **Heart rate (160 bpm)** is severely elevated (normal resting range: 60-100 bpm), indicating possible tachycardia.
- **Systolic blood pressure (84 mmHg)** is critically low (normal: 90-120 mmHg), suggesting hypotension.
- **Oxygen saturation (91%)** is below normal (normal: 95-100%), indicating potential oxygen deficiency.
- **Respiratory rate (27 breaths/min)** is elevated (normal resting: 12-20 breaths/min), reflecting increased breathing effort.

These combined findings—high heart rate, low blood pressure, low oxygen, and rapid breathing—are clinical indicators of a serious cardiovascular or respiratory emergency. They align with conditions such as heart attack (myocardial infarction) or life-threatening arrhythmias, as suggested by your algorithm diagnosis. Do not delay seeking emergency medical care.
